TEAM MEETING REPORT 5: CLEARPOLICY TEAM

COMP 496: SENIOR DESIGN II

FALL 2026

1 DETAILS

Date: October 20, 2026

Members Present: TJ, Amon, Anthony

2 AGENDA ITEMS

1. Review the app's approach to reading privacy-policy text.
2. Confirm the GPT model and API for the natural-language analysis.
3. Keep generated explanations separate from the rule-based Trust Score.
4. Review how the app supports its AI-generated takeaways with policy text.

3 ACCOMPLISHMENTS

The team clarified that the app should use natural-language analysis rather than a fixed-label clause classifier. The current implementation uses GPT-6 Luna (**gpt-6-luna**) through the OpenAI Responses API to generate a plain-language summary, quoted key points, wording to review, and reader questions. The backend checks that supporting excerpts appear in the submitted policy, and the structured response keeps these sections consistent for display without assigning fixed topic labels. The rules engine still calculates the Trust Score separately. Policy text is sent to OpenAI with response storage disabled (**store=false**). The generated explanation is marked experimental because its accuracy has not yet been evaluated against a held-out benchmark.

4 DECISIONS

1. Use GPT-6 Luna (gpt-6-luna) through the OpenAI Responses API for the app's policy-text NLP.
2. Keep the AI explanation separate from rule findings and the Trust Score.
3. Present the explanation as experimental and include supporting policy quotations.
4. Before the next demo, configure the backend API key and review a live response using the sample policy.
